No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

ANW64728-W64763 are peptides used in a novel method for accelerating the proliferation of mesenchymal stem cells (MSCs), haematopoietic clineage-specific cells. or mesenchymal liheage-specific cells. The method involves contacting the cells with an active agent comprising a sequence consisting of at least three contiguous amino acids of groups R1-R8 in the sequence of formula, R1-R2-R3-R4-R5-R6-R7-R8. R1 and R2 together form a group of formula X-Ra-Rb-, X = H or a 1-3 peptide group, R3 = Val, A1 Leu, norleu, 11e, G1y, Pro, A1b, Acpc (1-aminocyclopentane carboxylic acid) or Tyr, R4 = Tyr, Tyr(PO3)2, Thr, Ser, homoser or azaTyr, R5 = I1e, A1a, Leu, norleu, Val or G1y: R6 = His, A1 or C A14, R8 = Phe, Phe(BR), I1e or Tyr, Ra and Rb is azaTyr, R5 = I1e, A1a, R8 = Phe, Phe(BR), I1e or Tyr, Ra and Rb is labile to aminopeptidase A cleavage excluding sequences including R4 as a cterminal Tyr group. A second active agent comprising a sequence consisting of at least three contiguous amino acids of groups R2-R8 in the sequence of formula R2-R3-R4-R5-R6-R7-R8 where R2 = H, Arg, Lys, A1a, C Nn. Ser(Ac), Sar, D-Arg or D-Lys; R3, R4, R5, R6, R7, R8 is alos of mediums. These colls may be used in transplantation techniques for treatment of malignant or inherited diseases. The formulae represent canalogues of angiotensinogen, angiotensin I (A1), angiotensin II (A11),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Angiotensin II analogue 6 used to accelerate thermal wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Angiotensin; AII; acceleration; thermal wound healing; human; growth factor release; neovascularisation; re-epithelialisation; extracellular matrix production.
                                           Promoting haematopoietic and mesenchymal cell proliferation and differentiation - by contacting the cells with angiotensinogen, angiotensin I or II, or analogues or fragments of these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 8;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 37; DB 19; Length 8;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to the use of angiotensin II (AII), AII analogues, AII fragments and AII fragment analogues for promoting incorporation of a skin graft into underlying tissue of a mammal. The peptides are effective in accelerating the growth or healing of skin grafts and in accelerating re-epithelisation and tissue repair, even at very low concentrations. They can significantly accelerate the rate of healing at nanomolar levels in vivo. AII accelerates wound repair by increased neovascularisation. growth factor release, re-epithelisation, extracellular matrix production and increased flow of blood and nutrients to the injured tissue. Use of the above peptides other than AII itself (an extremely potent was occurrent to the injured tissue in the above perides of the side-effects of AII, such as increase in blood pressure and thirst. The present sequence represents an anglotensin

                                                                                                                                                                                                                                                              6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for treating or preventing infections in mammals by administering peptides (A) that are fragments or analogues (or their fragments) of anglotensinogen, angiotensins I or II, or anglotensin I AT_2-type receptor agonists. (A) contain at least 3 consecutive amino acids (aa) from the sequence (SI):
R1-R2-R3-R4-R5-R6-R7-R8 (SI); where R1 and R2 together = X-Ra-Rb-;
X = hydrogen or 1-3 aa; Ra = Asp, Glu, Asn, Acpc (1-aminocyclopentane parloxylic acid), Ala, dimethylglycine, Pro, betaine, Glu(NH_2), Gly, Asp(NH_2) or succinyl; Rb = Arg, Lys, Ala, ornithine, acetyl-Ser, sarcosine, D-Arg or D-Lys; R3 = Val, Ala, Leu, norleucine (NIe), Lys,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Angiotensin I; angiotensin II; angiotensinogen; AI; AII; infection; receptor agonist; septic shock; peritonitis; bacteraemia; endotoxaemia
                                                                                                                                                                                                                                                              Gaps
                                                         AAW71128-44 represent peptide analogues of angiotensisn II (AII). They are used in the method of the invention. The specification describes a method of accelerating thermal wound healing in humans. The method comprises applying to the thermally injured tissue an amount of at least one active agent which comprises the peptides of the invention. The method can be used to promote the healing of thermal wounds by accelerating growth factor release, necesscularisation, re-epithelialisation and extracellular matrix production. The sequences are analogues of the angiotensin or angiotensin of proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treating or preventing infections in mammals using peptides derived from angiotensin or angiotensin receptor agonists

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            converting enzyme anglotensings which removes the C-terminal His-Leu residues from AI (AAV43372).

The active agents Angiotensingen, Angiotensin I (AI), AI analogs, AI fragments and analogs, Angiotensin II (AII), AI analogs, AII fragments or analogs, or AII AT2 type 2 receptor agonists can arbidly provide a large population of ESCs (Embryonic Stem Cell) for use in replacement therapy. Similarly, methods that increase in vivo proliferation of ESCs will enhance the utility of replacement therapy by rapidly increasing local concentration of the stem cells and their progeny at the site of therapy. The method also increases the potential utility of ESCs as vehicles for gene therapy in certain disorders by more efficiently providing a large number of such cells for transfection,
Ile, Gly, Pro, Aib (2-aminoisobutyric acid), Acpc or Tyr; R4 = Tyr (optionally phosphorylated), Thr. Ser. homoserine, Pro, Ala or aza-Tyr; R5 = 11e, Ala, Leu, N1e, Val or Gly; R6 = H1s, Arg or 6-amino-Phe; R7 = Pro or Ala; R8 = Phe, 4-bromo-Phe, Ile or Tyr; proviso = sequences having R4 as a terminal Tyr residue are excluded. The method is particularly used in cases of bacterial infection (e.g. septic shock, peritonitis, bacteraemia or endotoxaemia) but also against viral and parasitic infections. AAV49586 to AAV49623 represent specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the amino acid sequence of the Angiotensin II analogue, 6. The formation of Angiotensin II (AII) is initiated by the action of renin on the plasma substrate angiotensinogen. This results in Angiotensin I (AI) which then converted to AII by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Promoting embryonal cell proliferation, using angiotensinogen and angiotensin peptides, analogs or fragments

fragments and AII analogues. The peptides are used in the method of the invention. The specification describes a method for mitigating radiation induced tissue damage, improving the effectiveness of radiation therapy, to support bone marrow transplantation, and promoting megakaryocyte production and mobilization and platelet production. The method comprises administration of the present peptides. The methods can be used to mitigate radiation induced tissue damage, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           improve the effectiveness of radiation therapy, to support bone marrow transplantation, and to promote megakaryocyte production and mobilization and platelet production. They are used particularly in cancer therapy. They can also be used to provide megakaryocytes as wehicles for gene therapy in hematopoietic disorders. By providing a more efficient means to rapidly expand transfected megakaryocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of angiotensin and angiotensin type peptides, for mitigating radiation induced tissue damage, improving bone marrow transplantation and promoting megakaryocyte and platelet production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY30583-Y30620 represent angiotensin I (AI) and angiotensin (II), AII
                                                                                                                                                                                                                              Angiotensin; analogue; radiation mitigation; tissue damage; radiation therapy; bone marrow transplantation; megakaryocyte production; platelet production; cancer therapy; gene therapy; hematopoletic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                An improved method for producing a tissue equivalent with angiotensin I and II derived active agents {}^{-}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           fragments and AII analogues. The peptides are used in the method of the invention. The specification describes an improved method for producting a tissue equivalent. The method comprises contacting the tissue equivalent. The method active agents. The methods are used for production and cilture of tissue equivalents (three-dimensional cell and tissue culture systems), chosen from skin, dermis, bone, bone marrow, pancreas, heart valve, vascular graft, cartilage, ligament, collagen lattice, liver and kidney tissue equivalents. The methods and tissue culture systems are used for the long-term proliferation of cells and tissues in an in vitro environment that more closely approximates that found

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 peptides AN32715-Y32749 are angiotensin II (AII) analogues. The peptides are derived from the AII peptide (AAY32750). AII increases mitogenesis and chemotaxis in cultured cells, and also increases the mitogenesis and chemotaxis in cultured cells. AII has also been shown to increase the proliferation of certain cell types. The AII andique peptides can be used as the active agent in a method for promoting hepatic cell proliferation and differentiation. The method involves contacting the hepatic cells with an amount effective enough to promote proliferation of any of the peptides. This method is useful in liver regeneration following resection of hepaticarionmas, hepatitis infection, cirrhosis of the liver, partial hepatcacrionmas, hepatitis infection, cirrhosis of the liver, partial hepatcacrionman dother fealure, hepatocyte transplantation, liver transplantation and other methods are also useful in rapidly providing a large population of transfected hepatic cells for use in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAY33769-Y33802 are fragments or analogues of the angiotensin application of angiotensin to wound tissue significantly increases the rate of wound healing. All is known to increase mitogenesis and chemotaxis in cultured cells, and also increase mitogenesis and chemotaxis in cultured cells, and also increase their release of growth differentiation. ATZ receptors are receptors for All and are thought to be involved in the mediation of the cell differentiation effects of AII. explained and an are thought to be involved in the mediation of the cell differentiation effects of AII. explained and an are thought to be involved in the mediation. This method is useful in the treatment of Alzheimer's and Parkinson's diseases by neuron replacement
                                                                                                                                          Angiotensin II; wound healing; mitogenesis; chemotaxis; growth factor; neuronal cell proliferation; differentiation; Alzheimer's disease; Parkinson's disease; neuron replacement therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

This is the amino acid sequence of an Angiotensin II analogue. This and other similar analogues (AAX15306 to AAX15316 and AAX15317 to AAX15341) can be used to promote the proliferation of epithelial stem cells and Keratinocytes leading to a more rapid and efficient cellular response to stratified epithelial injury. The angiotensin analogues are derived from an octappetide present in humans and other species which has the sequence of Asp-Arg-Val-Tyr-IIe-His-Pro-Phe (AAX15342) and is known as angiotensin II (AII). This is formed by the action of renin on the plasma substrate angiotensingen, the product of this reaction is a decappetide called angiotensin I (AII) which is converted to AII by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Promoting myocyte proliferation and myocardial tissue repair by contacting myocytes with angiotensinogen or angiotensin I or II, useful for treating heart attacks, cardiomyopathies, inflammation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method of promoting myocyte proliferation or differentiation by contacting myocytes with an active agent containing angiotensinogen, angiotensin I and II (AI, AII), and angiotensin analogs. The present sequence is an angiotensin II analog
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                 Epithelial stem cell and keratinocyte proliferation with angiotensin I and II derived active agents, useful for treatment of skin wounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Angiotensinogen; AII; AII; myocyte proliferation; myocardial injury; cardiomyopathies; inflammation; infection; sepsis; ischemia; heart valve disease; myocarditis; angiotensin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

                                                                                                                                                                                                                                                                                                                                                        This sequence is an angiotensin II (AII) analogue. Similar sequences also based on the AII peptide have been tested against each other, AII and a negative control. These active agents have been shown to affect the levels of BFU-E (burst forming units-erythroid) in culture. The active agents (AAVI5348, AAVI5359, AAVI5372, AAVI5379, and AAVI5380) augment erythropoiesis by potentiating erythropoiesis improves clinical benefits for the treatment of congenital or acquired aplastic or hypoplastic anemia associated with chronic renal failure, end-stage renal disease, renal transplantation, cancer, AIDS, chemotherapy, radiotherapy, bone marrow transplantation and chronic diseases. The active agents permit the use of smaller doses of erythropoietin therefore decreasing treatment costs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                     Promoting erythropoiesis with angiotensin I and II derived active agents, useful for treatment of, e.g. congenital or acquired aplastic or hypoplastic anemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention is concerned with peptide analogues of angiotensin II (AII) which can be used to limit scar and adhesion formation. The application of AII to wound tissue results in a rapid increase in the rate of wound healing and causes the proliferation of certain calls, such as epithelial cells and keratinocytes. Analogues of the protein have been shown to reduce scar formation, and can be used not only to limit new scar formation but also to therapeutically treat existing scars. The wound types include lacerations, burns, punctures, trauma, ulcers, periodoital conditions, laparotomy and incisional wounds, revision of hypertrophic scars, genetic hypertrophic scars, keloid scars, contractures after burns and cosmetic surgical procedures.
of the invention. The active agents of the invention may be useful for promoting myocardial tissue repair following myocardial injury and for treating heart failure in a mammal. Administration to accelerate in vivo myocyte proliferation and/or to treat myocardial injuries can be used to treat cardiomyopathies, inflammation, infection, sepsis, ischemia, heart valve disease, myocarditis, inflammation, myocardial ischemia and infarction and for improving cardiac output by increasing
                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Limiting scar or adhesion formation comprises administering at least

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents an angiotensin II analogue. The specification also describes peptides derived from angiotensinogen, angiotensin II, andiotensin III, and their analogues. The peptides are used for increasing blood flow to ischemic tissue. The peptides are angiogenesis stimulators. The peptides are useful for increasing blood flow to ischemic tissue by stimulating angiogenesis, and minimizing cardiac remodelling and development of congestive heart disease following a ischemic myocardial infarction. The stimulation of angiogenesis is also useful for embyronic development, wound healing and treating chronic inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Increasing blood flow to ischemic tissue for minimizing cardiac remodelling and development of congestive heart failure involves administration of an active agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cancer, and from side effects of medical treatment and age-related loss of bone mass. Congenital or trauma induced cartilaginous tissue defects can also be treated using the pertides. Bony ingrowth into various prosthetic devices is greatly enhanced via use of the peptides. They are used to treat chondrocytic cell lines such as articular chondrocytes which can in turn be used for gene therapy applications. Use of the peptides accelerates bone growth, allowing implants to be firmly anchored into surrounding skeletal tissue, reducing the need for reoperation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enhancing bone, cartilage repair for treating fractures, defects and disorders like osteoporosis, osteoarthritis and other cartilage defects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                             (WBC) survival following chemotherapy using angiotensinogen, angiotensin and angiotensin and angiotensin and angiotensin and angiotensin and angiotensin and patients for increasing WBC survival following chemotherapeutic treatments, as well as for decreasing the adverse effects of chemotherapy on the bone marrow. The present sequence represents a peptide used in the exemplification of the present invention.
The present invention describes a method for increasing white blood cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Smooth muscle cell proliferation; SMC; angiotensinogen; treatment; prevention; restenosis; atherosclerosis; vascular wall hypertrophy; vascular wall hyperplasia; angiotensin II; AII.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                            The patent discloses methods and pharmaceutical compositions for inhibiting smooth muscle cell (SMC) proliferation. The method involves contacting smooth muscle cells with at least one active of angiotensing a sequence selected from the group consisting of angiotensinogen, angiotensin or their analogues. The method is useful for treating or preventing disorders associated with smooth muscle cell proliferation, particularly restenosis, atherosclerosis, vascular wall hypertrophy or vascular wall hypertrophy or vascular wall hypertrophy or useful (AII) analogue 6. This sequence is used in the method of the invention.
                                                                                                                                Inhibiting smooth muscle cell proliferation, useful for treating or preventing e.g. restenosis, atherosclerosis, or vascular wall hypertrophy or hyperplasia, by administering angiotensinogen, angiotensin or their analogs
                                                                                                                                                                                                                                                                                                                                                                                              ö

The method is used to treat or prevent damage to mucosal tissue associated with bacterial, viral, or fungal infections, ulcerations, autoimmune disorders, septic shock, allergic or non-allergic rhinitis, haemorrhagic shock, endotoxaemia, oral mucositis, burning mouth syndrome, lichen planus, denture sores, ginglvitis, recent oral surgical sites, cervical dysplasia, vulva leukoplakia, Bechets Syndrome, radiotherapy induced mucositis, post-operative gum pain, traumatic mouth lesions, post-radiotherapy vaginitis, non-specific vaginal inflammatory conditions, nonspecific ulcer of colon, ulcerative colitis induced by nonspecific inflammations, or crohn's disease. The present sequence is human angiotensin II (AII) peptide analogue 6.
                                                                                                                                                                 Treating and preventing damage to mucosal tissue, comprises administering an active agent consisting or containing anglotensinogen, anglotensin I, anglotensin II, or analogs or fragments of them
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; antidiabetic; nephrotropic; therapy; diabetic complication; angiotensinogen; angiotensin II; AII; proteinuria; diabetic nephropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating and preventing diabetic complications, comprises administering an active agent consisting or containing angiotensinogen, angiotensin I, angiotensin II, or analogs or fragments of them
                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for treating and preventing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              one of the most potent vasconstrictors known, causing constriction of the arterioles. The formation of anglotensin is initiated by the action of renin on anglotensingen. The substance formed is a decapeptide called anglotensing. The forward of anglotensing the called anglotensing which is converted by the enzyme anglotensinase (by removal of the C-terminal His-Leu) into AT2. AT2 increases the release of extracellular matrices involved in wound repair. These fragments can be used in a compound for accelerating wound healing. The compounds are administered as matrical or micellar solutions, formulated with a carrier or diluent, alternatively the compound is applied in conjuncture with a wound dressing. The carrier used in the composition is preferably carboxymethylcellulose, crystaloids, viscoelastics, or poly glycols. By using fragments of this sequence (or analogues of it), growth as well as healing of tissues is improved, such as in cases of
         The present invention relates to a method for treating and preventing diabetic complications comprising administering to a diabetic subject, at least one active agent consisting or containing angiotensinogen, angiotensin I, angiotensin II, or analogues or fragments of them. The method is used to treat and prevent diabetic complications, such as, proteinuria or diabetic nephropathy.

The present sequence is human angiotensin II (AII) peptide analogue 6.
                                                                                                                                                                                        Gaps

The peptides are effective in accelerating the growth or healing of skin grafts and in accelerating re-epithelisation and tissue repair, even at very low concentrations. They can significantly accelerate the rate of healing at nanomolar levels in vivo. AII accelerates wound repair by increased neovascularisation, growth factor release, re-epithelisation, extracellular matrix production and increased flow of blood and nutrients to the injured tissue. Use of the above peptides other than AII itself (an extremely potent vasoconstrictor) may avoid the side-effects of AII, such as increase in blood pressure and thirst. The present sequence represents an angiotensin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               angiotensin II; skin graft; AII analogue; tissue repair; vasoconstrictor; wound healing.
wounds on the skin (e.g. ulcers, burns, periodontal disease, cuts) or intraperitoneal surgical wounds. The compounds containing the AT2 fragments are less hypertensive than full length AT2, and are also effective at much lower (nanomolar) concentrations than full length AT2.
                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Promoting incorporation of skin graft onto underlying tissue - comprises pre-treating graft with angiotensin II, or analogue or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ANG AAW64728-W64763 are peptides used in a novel method for accelerating the proliferation of mesenchymal stem cells (MSCs), haematopoietic clineage-specific cells. The method involves contacting the cells with an active agent comprising a sequence involves contacting the cells with an active agent comprising a sequence consisting of at least three contiguous amino acids of groups R1-R8 in the sequence of formula R1-R2-R3-R4-R5-R6-R7-R8. R1 and R2 together comprising of at least three contiguous amino acids of groups R1-R8 in Cform a group of formula X-Ra-Rb-, X = H or a 1-3 peptide group, R3 = Val, Cform a group of formula X-Ra-Rb-, X = H or a 1-3 peptide group, R3 = Val, Cform a group of formula X-Ra-Rb-, X = H or a 1-3 peptide group, R3 = Val, Cformula X-Ra-Rb-, X = H or a 1-3 peptide group, R3 = Val, Cformula R2-RB = Phe, Phe(BR), II or Tyr, Ra and Rb are not defined in the specification, the peptide bond between Ra and Rb is not defined in the specification, the peptide bond between Ra and Rb is consisting of at least three contiguous amino acids of groups R2-R8 in the second active agent comprising a sequence corresponded formula R2-R3-R4-R5-R6-R7-R8 where R2 = H, Arg, Lys, Ala, Corn, Ser(Ac), Sar, D-Arg or D-Lys, R3, R4, R5, R6, R7, R8 is alos consisting of a inventions are particularly useful in cell culture conditions. These colls may be used in transplantation techniques for treatment of malignant or inharited diseases. The formulae represent considered an analogues of anglotensinogen, anglotensin I (AI), anglotensin II (AII),

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAW71110-27 represent peptide used in the method of the invention. The specification describes a method of accelerating thermal wound healing in humans. The method comprises applying to the thermally injured tissue an amount of at least one active agent which comprises the peptides AAW71115-27. The method can be used to promote the healing of thermal wounds by accelerating growth factor release, neovascularisation, re-epithelialisation and extracellular matrix production. The sequences are analogues of the angiotensin or angiotensinogen family of proteins.

The present invention describes a method for treating or preventing infections in mammals by administering peptides (A) that are fragments or analogues (or their fragments) of angiotensingen, angiotensing I or or angiotensin II AT_2-type receptor agonists. (A) contain at least I consecutive amino acids (aa) from the sequence (SI):

AL-RS-RR-RR-RS-RR-RR (SI): where RI and R2 together = x-Ra-Rb-;

A = hydrogen or 1-3 aa; Ra = Asp, Glu, Asn, Acpc (1-aminocyclopentane carboxylic acid), Ala, dimethylglycine, Pro, betaine Glu(NH_2), Gly, Asp(NH_2) or succintyl; Rb = Arg, Lys, Ala, corithine, acetyl.Ser, Sarcosine, D-Arg or D-Lys; R3 = Arg, Lys, Ala, corithine, acetyl.Ser, Coptionally phosphorylated), Thr. Ser, homoserine, Pro, Ala or aza-Tyr; R5 = Ile, Ala, Leu, Nle, Val or Gly; R6 = His, Arg or 6-amino-Phe; R7 = Pro or Ala; R8 = Phe, 4-bromo-Phe, Ile or Tyr; proviso = sequences having R4 as a terminal Tyr residue are excluded. The method is particularly used in cases of bacterial infection (e.g. septic shock, parasitic infections. AAY49586 to AAY49623 represent specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Angiotensin I; angiotensin II; angiotensinogen; AI; AII; infection; receptor agonist; septic shock; peritonitis; bacteraemia; endotoxaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for treating or preventing in frections in mammals by administering peptides (A) that are fragments of or analogues (or their fragments) of analogues, analogues in the fragments of analogues (A) contain at least in or anglotensin II AT_2-type receptor agonists. (A) contain at least consecutive amino acids (aa) from the sequence (S1):

                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for treating or preventing infections in mammals by administering peptides (A) that are fragments or infections in mammals by administering peptides (A) that are fragments or analogues (Or their fragments) of anglotensingen, anglotensins I or II, or anglotensin II AT_2-type receptor agonists. (A) contain at least 3 consecutive amino acids (aa) from the sequence (S1):

R1-R2-R3-R4-R4-R6-R6-R7-R8 (S1): where R1 and R2 together = x-Ra-Rb-;

X = hydrogen or 1-3 aa, Ra = Asp, Glu, Asn, Acpc (1-aminocyclopentane carboxylic acid), Ala, dimethylglycine, Pro, betaine, Glu(NH_2), Gly, Asp(MH_2) or succinyll; RD = Arg, Lys, Ala, conithine, acetyl-Ser, Sarcosine, D-Arg or D-Lys; R3 = Val, Ala Leu, norleucine (NLe), Lys, Clottionally phosphorylated), Thr. Ser, homoserine, Pro, Ala or aza Tyr; R5 = Ile, Ala, Leu, NLe, Val or Gly; R6 = His, Arg or 6-amino-Phe; R7 = Pro or Ala; R8 = Phe, 4-bromo-Phe, Ile or Tyr; proviso = the phe, 4-bromo-Phe, Ile or Tyr; proviso = the phentilis, bacteraemia or endotoxaemia) but also against viral and consistic infections. This invaling describes a nove metroof for the use and preparation or cell activating compositions which involves preparing a cell activating composition compositions which involves preparing a cell activating composition compositions which involves preparing a cell activating composition or higher ph to produce a homogenate; (b) removing to particulates from the homogenate; (c) optionally incubating the particulates from the homogenate and selecting fractions that exhibit cell activation activity. The methods can be used for improving tractionation activity. The methods can be used for improving traction that exhibit cell activation activity. The methods can be used for improving traction of alsease, inflammatory disease, trauma, autoimmune diseases, arthritis, cryan rejection, diabetes and diabetic complications, stroke, ischemits, alzheimer's disease, myocardial infarction, haemorrhagic shock, diabetic corgan rejection, diabetes, venous insufficiency, unstable angina or trauma. They can be used in the veterinary treatment of a non-human subject.

They can be used in the veterinary treatment of a non-human subject. Protease inhibitors can be used to lower cell activation resulting from these diseases and deficiencies. The detection of an elevated level of hydrogen peroxide dismutase (SOD) indicates leukocyte up the hydrogen peroxide dismutase (SOD) indicates leukocyte up tragilation, e.g. indicative of the onset of an acute cardiovascular disorders, such as disease onset or ischemic complications. An elevated level of hydrogen peroxide in plasma or whole blood and a low level in the presence of SOD is indicative of a chronic or immune compromised condition e.g. hypertension or sepsis. AAX50201-Y50334 represent peptides condition e.g. hypertension or sepsis. AAX50201-Y50334 represent peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diagnosis and treatment of e.g. cardiovascular, inflammatory, autoimmune or Alzheimer's disease, trauma, arthritis, organ rejection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method for the use and preparation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

improved method for producing a tissue equivalent with angiotensin I II derived active agents \,
                                                                                                                                                                                                                                                                             fragments and AII analogues. The peptides are used in the method of the invention. The specification describes an improved method for producing a tissue equivalent. The method comprises contacting the tissue equivalent with angiotensin I and II derived active agents. The methods are used for production and culture of tissue equivalents (three-dimensional cell and tissue culture systems). Chosen from skin, dermis, bone, bone marrow, pancreas, heart valve, vascular graft, cartilage, ligament, collagen lattice, liver and kidney tissue equivalents. The methods and tissue culture systems are used for the long-term proliferation of cells and tissues in an in vitro environment that more closely approximates that found
                                                                                                                                                                                                                                                               AAY30539-80 represent angiotensin I (AI) and angiotensin (II), AII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amino acid sequence of an angiotensin II (AII) fragment AII1-7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Angiotensin; analogue; radiation mitigation; tissue damage; radiation therapy; bone marrow transplantation; megakaryocyte production; platelet production; cancer therapy; gene therapy; hematopoietic disorder.

AII(1-7). The formation of Angiotensin II (AII) is initiated by the
action of renin on the plasma substrate angiotensinogen.

This results in Angiotensin I (AI) which then converted to AII by the
converting enzyme angiotensinase which removes the C-terminal His-Leu
residues from AI (AAY42372).

Angiotensinogen, Angiotensin I (AII), AI analogs, AII fragments and
analogs, Angiotensin II (AII), AII analogs, AII fragments or analogs,
contained of ESCS (Embryonic Stem Cell) for use in replacement therapy.
Similarly, methods that increase in vivo proliferation of ESCS will
concentration of the stem cells and their progeny at the site of
therapy. The method also increases the potential utility of ESCS as
vehicles for gene therapy in certain disorders by more efficiently
providing a large number of such cells for transfection, and also by
providing a more efficient means to rapidly expand transfected ESCS.

                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                  AAY30583-Y30620 represent angiotensin I (AI) and angiotensin (II), AII fragments and AII analogues. The peptides are used in the method of the invention. The specification describes a method for mitigating radiation induced tissue damage, improving the effectiveness of radiation therapy, to support bone marrow transplantation, and promoting megakaryocyte production and mobilization and platelet production. The method comprises administration of the present peptides. The methods can be used to mitigate radiation induced tissue damage, to improve the effectiveness of radiation therapy, to support bone marrow transplantation, and to promote megakaryocyte production and
                                                    Use of angiotensin and angiotensin type peptides, for mitigating radiation induced tissue damage, improving bone marrow transplantation and promoting megakaryocyte and platelet production
                                                                                                                                                                                                                   transplantation, and to promote megakaryocyte production and mobilization and platelet production. They are used particularly in cancer therapy. They can also be used to provide megakaryocytes as weblicles for gene therapy in hematopoietic disorders, by providing a more efficient means to rapidly expand transfected megakaryocytes.
                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatic cell proliferation with angiotensin I and II derived active

Peptides AAY32715-Y32749 are angiotensin II (AII) analogues. The peptides are derived from the AII peptide (AAY32750). AII increases introgenesis and chemotaxis in cultured cells, and also increases the introgenesis and chemotaxis in cultured cells, and also increases the release of growth factors and extracellular matrices. AII has also been shown to increase the proliferation of certain cell types. The AII canalogue peptides can be used as the active agent in a method for promoting hepatic cell proliferation and differentiation. The method involves contacting the hepatic cells with an amount effective enough to promote proliferation of any of the peptides. This method is useful in liver respensation following respection of hepaticcachinoms, hepatic clinication, cirrhosis of the liver, partial hepatectomy, fulminant hepatic failure, hepaticyte transplantation, liver transplantation and other methods are also useful in rapidly providing a large population of hepatic cells for use in cell therapy and for providing a large population of population of transfected hepatic cells for use in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences AAY33769-Y33802 are fragments or analogues of the anglotensin II (AII) octapeptide (AAY33768) and they have AT2 agonist activity. The application of angiotensin to wound tissue significantly increases the rate of wound healing. AII is known to increase mitogenesis and chemotaxis in cultured cells, and also increases their release of growth factors and extracellular matrices, implicating it in cell growth and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Anglotensin II; wound healing; mitogenesis; chemotaxis; growth factor; neuronal cell proliferation; differentiation; Alzheimer's disease; Parkinson's disease; neuron replacement therapy.

This is the amino acid sequence of an Angiotensin II analogue. This and other similar analogues (AAV15306 to AAV15316 and AAV15321 to AAV15337) can be used to promote the proliferation of epithelial stem cells and Keratinocytes leading to a more rapid and efficient cellular response to stratified epithelial injury. The angiotensin analogues are derived from an octapeptide present in humans and other species which has the sequence of ASP-Arg-Val-Tyr-Ile-His-Pro-Phe (AAV15342) and is known as angiotensin II (AII). This is formed by the action of renin on the plasma substrate angiotensinogen, the product of this reaction is a decapeptide called angiotensin I (AI) which is converted to AII by the converting enzyme angiotensinase which removes the C-terminal His-Leu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Epithelial stem cell and keratinocyte proliferation with angiotensin I and II derived active agents, useful for treatment of skin wounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    angiotensin; angiotensin II; AII; wound healing; scarring;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 36; DB 20; Length 7;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence is an angiotensin II (AII) analogue. Similar sequences also based on the AII peptide have been tested against each other, AII and a negative control. These active agents have been shown to affect the levels of BFU-E (burst forming units-erythroid) in culture. The active agents (AAY15348, AAY15359, AAY15372, AAY15379, and AAY15380) augment erythropoiesis by potentiating erythropoiesis improves clinical benefits for the treatment of congenital or acquired aplastic or hypoplastic anemia associated with chronic renal failure, end stage renal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  disease, renal transplantation, cancer, AIDS, chemotherapy, radiotherapy, bone marrow transplantation and chronic diseases.
The active agents permit the use of smaller doses of erythropoietin
differentiation. ATZ receptors are receptors for AII and are thought to be involved in the mediation of the cell differentiation effects of AII septides AAY33768-Y33802 are used in a method for promoting neuronal cell proliferation or differentiation. This method is useful in the treatment of Alzheimer's and Parkinson's diseases by neuron replacement
                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   units-erythroid; BFU-E; erythropoiesis; angiotensin; chronic renal failure; cancer; bone marrow.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is an angiotensin II (AII) analogue. Similar sequences also based on the AII peptide have been tested against each other. AII and a negative control. These active agents have been shown to affect the levels of BRU-E (burst forming units-erythroid) in culture. The active agents (AAY15348, AAY15359, AAY15372, AAX15379, and AAY15380) augment erythropoiesis by potentiating erythropoiethin-induced differentiation. Increasing the rate of erythropoiesis improves clinical hypoplastic anemia associated with chronic renal failure, end-stage renal disease, renal transplantation and chronic diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The active agents permit the use of smaller doses of erythropoietin therefore decreasing treatment costs.
                                                                                                              burst forming units-erythroid; BFU-E; erythropoiesis; anglotensin; AII; analogue; chronic renal failure; cancer; bone marrow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Promoting erythropoiesis with angiotensin I and II derived active agents, useful for treatment of, e.g. congenital or acquired aplastic or hypoplastic anemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Seguence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAY21838;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY21838
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT
NAME OF THE PROPERTY OF THE PR
```

```
R1-Árg-R2-Tyr(P03)2-R4-His-Pro-R5 (II); R1-Arg-R2-homoSer-R4-His-Pro-R5 (II); and R1-Arg-R2-R3-His-Pro-R5 (IV), where R1 = H or Asp; R2 = Val or norLeu; R3 = Tyr, Tyr(P03)2 or homoSer; R4 = Ile or norLeu; and R5 = H, Phe or Ile. The compounds are disposed on wound dreasing for accelerating wound healing. The compositions are based on chemical analogs of anglotensin II or its fragments. Sequences ANY21827-830, AAY21832 -33 and AAY21838 expresent specific examples of wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a compound (C) for accelerating wound healing, that has at least five contiguous amino acids of a general formula (I)-(IV). The compound can be R1-Arg-norLeu-R3-R4-His-Pro-R5 (I);
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

of the invention. The active agents of the invention may be useful for promoting myocardial injury and for treating myocardial injury and for treating heart falure in a mammal. Administration to accelerate in vivo myocyte proliferation and/or to treat myocardial injuries can be used to freat cardiomyopathies, inflammation, inflection, sepsis, ischemia, heart valve disease, myocarditis, inflammation, myocardial ischemia and infarction and for improving cardiac output by increasing

stroke volume.

                                                                                                                                                                                                                                                                                                               The present sequence is a peptide used as a test for the novel anion exchange resin aminomethyl-resin (EPW-1). The peptide has a charge of plus 2 and so acts as a control for the occurrence of unspecific interactions in the EPM-1 matrix. The EPM-1 resin can be used in column liquid chromatography, in particular for the separation of ionic solutes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Promoting myocyte proliferation and myocardial tissue repair by contacting myocytes with angiotensinogen or angiotensin I or II, useful for treating heart attacks, cardiomyopathies, inflammation and
                                                                                                                                                     New crosslinked polystyrene containing aminomethyl groups, useful as ion-exchange resin, particularly for separation of biomolecules from electrophoretic gel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Angiotensinogen; AII; AII; myocyte proliferation; myocardial injury; cardiomyopathies; inflammation; infection; sepsis; ischemia; heart valve disease; myocarditis; angiotensin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method of promoting myocyte proliferation or differentiation by contacting myocytes with an active agent containing angiotensinogen, angiotensin I and II (A1, AII), and angiotensin analogs. The present sequence is an angiotensin II analog of the invention. The active agents of the invention may be useful for promoting myocardial tissue repair following myocardial injury and for treating heart failure in a mammal. Administration to accelerate in vivo myocyte proliferation and/or to treat myocardial injuries can be used to treat cardiomyopathies, inflammation, infection, sepsis, ischemia, heart valve disease, myocarditis, inflammation, myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            schemia and infarction and for improving cardiac output by increasing

7 AA;

Sequence

The present invention relates to a method of promoting myocyte proliferation or differentiation by contacting myocytes with an active agent containing angiotensinogen, angiotensin I and II (AI, AII), and angiotensin analogs. The present sequence is an angiotensin II analog

AAB28102 standard; Peptide; 7 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method of promoting myocyte proliferation or differentiation by contacting myocytes with an active agent containing angiotensingen, angiotensin I and II (AL, AII), and angiotensin analogs. The present sequence is an angiotensin II analog of the invention. The active agents of the invention may be useful for promoting myocardial tissue repair following myocardial injury and for treating heart failure in a mammal. Administration to accelerate in vivo myocyte proliferation and/or to treat myocardial injuries can be used to treat cardiomyopathies, inflammation, infection, sepsis, ischemia, heart valve discase, myocarditis, inflammation, myocardial injuries and inschemia and infarction and for improving cardiac output by increasing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention is concerned with peptide analogues of angiotensin II (AII) which can be used to limit scar and adhesion formation. The application of AII to wound tissue results in a rapid increase in the rate of wound healing and causes the proliferation of certain cells, such as epithelial cells and keratinocytes. Analogues of the protein have been shown to reduce scar formation, and can be used not only to limit new scar formation but also to therapeutically treat existing scars. The wound types include lacerations, burns, punctures, trauma, ulcers, periodontal conditions, laparotomy and incisional wounds, revision of hypertrophic scars, genetic hypertrophic scars, keloid scars, contractures after burns and cosmetic surgical procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```
The present invention is concerned with peptide analogues of angiotensin II (AII) which can be used to limit scar and adhesion formation. The application of AII to wound tissue results in a rapid increase in the rate of wound healing and causes the proliferation of certain cells, such as epithelial cells and keratinocytes. Analogues of the protein have been shown to reduce scar formation, and can be used not only to limit new scar formation but also to therapeutically treat existing scars. The wound types include lacerations, burns, punctures, trauma, ulcers, periodontal conditions, laparotony and incisional wounds, revision of hypertrophic scars, genetic hypertrophic scars, keloid scars, contractures after burns and cosmetic surgical procedures.
                                                                                          Limiting scar or adhesion formation comprises administering at least one active agent comprising a peptide -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        o;
                                                                                                                                                                                                                                                                                                                                                 The present invention is concerned with peptide analogues of angiotensin application which can be used to limit scar and adhesion formation. The application of AII to wound tissue results in a rapid increase in the rate of wound healing and causes the proliferation of certain cells, such as epithelial cells and keratinocytes. Analogues of the protein have been shown to reduce scar formation, and can be used not only to limit new scar formation but also to therapeutically treat existing scars. The periodontal conditions, burns, punctures, trauma, ulcers, periodontal conditions, laparotony and incisional wounds, revision of hypertcophic scars, genetic hypertrophic scars, keloid scars, contractures after burns and cosmetic surgical procedures.
                                                                                                                                                                                                                                                                                   Limiting scar or adhesion formation comprises administering at least one active agent comprising a peptide \boldsymbol{\cdot}

                                 specification describes a human angiotensin converting enzyme-2 (ACE-2). ACE-2 is expressed predominantly in kidneys and testis. The sequence of the full length ACE-2 CDNA was determined from a clone obtained from a cDNA library prepared from mRNA of a human heart of a subject who had congestive heart failure. ACE-2 has significant sequence homologies with ACE enzymes, and has also been shown to hydrolyse angiotensin I into Ang. (19). The ACE-2 therapeutics are used to treat blood pressure related diseases and conditions, such as hypertension, congestive heart failure, chronic heart failure, acute heart failure, myocardial infarction, atherosclerosis and renal failure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specification also describes peptides derived from angiotensinogen, angiotensin I, angiotensin II, angiotensin III, and their analogues. The peptides are used for increasing blood flow to ischemic tissue. The peptides are angiogenesis stimulators. The peptides are useful for increasing blood flow to ischemic tissue by stimulating angiogenesis, and minimizing cardiac remodelling and development of congestive heart disease following a ischemic myocardial infarction. The stimulation of axgiogenesis is also useful for embyronic development, wound healing and treating chronic inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Increasing blood flow to ischemic tissue for minimizing cardiac remodelling and development of congestive heart failure involves

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     specification also describes peptides derived from angiotensingen, angiotensin I, angiotensin II, angiotensin II, angiotensin II, angiotensin II, angiotensin III, and their analogues. The peptides are used for increasing blood flow to ischemic tissue. The peptides are angiogenesis stimulators. The peptides are useful for increasing blood flow to ischemic tissue by stimulating angiogenesis, and minimizing cardiac remodelling and development of congestive heart diseasé following a ischemic myccardial infarction. The stimulation of angiogenesis is also useful for embyronic development, wound healing and treating chronic inflammatory disease.
                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The specification also describes peptides derived from angiotensinogen, angiotensin II, angiotensin III, and their analogues. The peptides are used for increasing blood flow to ischemic tissue. The peptides are angiogenesis stimulators. The peptides are useful for increasing blood flow to ischemic tissue by stimulating angiogenesis, and minimizing cardiar remodelling and development of congestive heart disease following a ischemic myocardial infarction. The stimulation of angiogenesis is also useful for embyronic development, wound healing and treating chronic inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Increasing blood flow to ischemic tissue for minimizing cardiac remodelling and development of congestive heart failure involves
                                                                                                                                                        Amino acid sequence of a peptide derived from angiotensin II.

Sequences AAY77037-Y77046, AAY77049 and AAY77051-Y77080 represent peptides which enhance bone and cartilage repair when administered to a mammal. The peptides include angiotensin II (AII, AAY77037), AII ragments (AAY77031), AII analogues (AAY77049, AII analogues (AAY77049, AII analogues (AAY77049, AII) analogues (AAY7049, AII) analogues (AAY77049, AAY77071, AAY77073. The peptides stimulate bone and cartilage repair and regeneration, and stimulate the proliferation of chondrocytes and mesenchymal stem cells. Acceleration of new bone formation was tested by using female Sprague-Davley rats with a defect in the tibia. The defect was placed with a formulation comprising AII (DRVYIMPP). The AII-treated animals chowed an extensive stromal cell ingrowth with numerous blood vessels and approximately 50% of these animals exhibited new bone formation. The peptides of the invention are used for enhancing bone repair in mammals suffering from bone fractures, defects and disorders such as osteoporosis, osteoparthiis, Paget's disease, osteohalisteresis, osteomalacia, periodontal disease, bone loss from multiple myeloma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancer, and from side effects of medical treatment and age-related loss cancer, and from side effects of medical treatment and age-related loss of bone mass. Congenital or trauma-induced cartilaginous tissue defects can also be treated using the peptides. Bony ingrowth into various prosthetic devices is greatly enhanced via use of the peptides. They are used to treat chondrocytic cell lines such as articular chondrocytes which can in turn be used for gene therapy applications. Use of the peptides accelerates bone growth, allowing implants to be firmly anchored into surrounding skeletal tissue, reducing the need for reoperation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

compared which enhance bone and cartilage repair when administered to a mammal. The peptides include angiotensin II (AII, AAY7031), AII analogues (AAY70031-Y7004), AII analogues (AAY70031-Y7004).

fragments (AAY77031-AAY77003) and angiotensin I (AI, AAY7072).

The peptides stimulate bone and cartilage repair and regeneration, and stimulate the proliferation of chondrocytes and mesenchymal stem cells.

CC Sprague-Dawley rats with a defect in the tibia. The defect was placed with a formulation comprising AII (DRYYHPF). The AII-treated animals showed an extensive stromal cell ingrowth with numerous blood vessels and approximately 50% of these animals exhibited new bone formation. The peptides of the invention are used for enhancing bone repair in mammals suffering from bone fractures, defects and disorders such as suffering from bone fractures, defects and disorders such as suffering from bone fractures, defects and disorders such as consentation of medical treatment and age-related loss of bone mass. Congenital or trauma-induced cartilaginous tissue defects can also be treated using the peptides. Bony ingrowth into various prosthetic devices is greatly enhanced via use of the peptides. They are used for gene therapy applications. Use of the peptides accelerates bone growth, allowing implants to be firmly anchored reminibation of prosthetic devices found in turn be used for gene therapy applications. Use of the reminibation of prosthetic devices is decided for gene therapy applications of the reperation and complements of the peptides accelerates bone growth, allowing implants to be firmly anchored reminibation of prosthetic devices is decided for gene therapy applications of the reperation and deciminal and accelerates bone growth, allowing the need for reoperation and deciminal and accelerates bone growth, allowing the need for reoperation and deciminal and accelerates a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequences AAY77037-Y77046, AAY77048-Y77049 and AAY77051-Y77080 represent

The method can be used particularly in cancer patients for increasing WBC survival following chemotherapeutic treatments, as well as for decreasing the adverse effects of chemotherapy on the present sequence represents a peptide used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                         The present invention describes a method for increasing white blood cell

C; Comment: Angiotensin I is released from angiotensinogen by renin, which is secreted
I (angiotensin-converting enzyme), primarily in the lungs
C; Comment: The release of the mainor-terminal residue (Asp-25) from angiotensin I and sp-llangiotensin I is converted to angiotensin II by dipetidyl carboxypeptidase I.
C; Comment: Angiotensinogen is synthesized in the liver and secreted into the plasma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A; Cross-references: GB: AF045887; GB: J03046; NID: 92842773; PIDN: AAC01765.1; PID: 928427

Cyberical protein T8L23.8 [imported] - Arabidopsis thaliana
Cyberics: Arabidopsis thaliana (mouse-ear cress)
C; Species: Arabidopsis thaliana (mouse-ear cress)
C; Species: Arabidopsis thaliana (mouse-ear cress)
C; Species: Cyber. 2001 #sequence_revision 02-Mar-2001 #text_change 31-Mar-2001
C; Accession: C96610
R; Theologis, A.; Ecker, J.R.; Palm, C.J.; Federspiel, N.A.; Kaul, S.; White, O.; Alon Chin, C.W.; Chung M.K.; Conn, L.; Conway, A.B.; Conway, R.R.; Creasy, T.H.; Dewar, ansen, N.F.; Hughes, B.; Huizar, L.
Nature 408, 816-820, 2000
A; Huizar, J.L.; Jenkins, J.; Johnson-Hopson, C.; Fihan, S.; Khaykin, E.; Kim, C.A.; Li, J.H.; Li, Y.; Lin, X.; Liu, S.X.; Liu, Z.A.; Lurcs, J.S.; Maiti, R.; Marzia Rizzo, M.; Rooney, T.; Rowley, D.; Sakano, H.
A; Authors: Salzberg, S.L.; Schwartz, J.R.; Shinn, P.; Southwick, A.M.; Sun, H.; Tallo A; Title: Sequence and analysis of chromosome 1 of the plant, Arabidopsis.
A; Reference number: A86141; MuID:21016719
A; Status: preliminary
A; Molecule type: DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   hypothetical protein [imported] - Arabidopsis thaliana Cispecies: Arabidopsis thaliana (mouse-ear cress)
